**Clinical Scenario:**

A 40-year-old lady presented with discomfort in left lower quadrant (LLQ) since one month ago. The only positive point in her previous history was left sided oophorectomy because of incidental mass discovered during cesarean section nine years back. Histologic examination was in favor of dermoid cyst. On physical examination, a mass was palpable in LLQ. All lab data including ovarian tumor markers were normal. CT scan is demonstrated. What is your diagnosis?
