About this report

This open peer review (OPR) report shows the public comments made on this article during peer review, by the reviewers, the associate editor and the editor-in-chief, for every revision round, together with the authors' replies. Comments appear only with the consent of the people who wrote them. Reviewers who chose to sign their report are named; the others are shown as "Referee". Comments are edited for language only, and confidential remarks to the editors are not included.

MAJOR REVISION 27 May 2024

Thank you to the respected authors for your valuable work. Some points need to be corrected or completed.
Abstract:
1- Describe the group allocation and the number of participants in each group in the methods section.
2- Correct the writing in the conclusion section.
Introduction:
3- If reference 19 is used in the methods section, move the text citing this reference from this section to the methods section.
Methods
4- In the methods section, explain the basis for the administered oxytocin dose and protocol. Is it reference 19? Describe the separate groups and the number of participants in each.
5- Describe the outcomes assessed and how each was evaluated separately and precisely in the methods section.
6- The ethical considerations section should state that the study is a medical record review, that the patients receiving treatment had given their consent, and that the ethical principles of the Declaration of Helsinki were observed for the study participants.
7- In Table 1, correct the heading to Demographic characteristics. Report the mean or frequency for each variable separately, and place the number of participants above each of the two groups (Table 4). Also specify the statistics used in the text or below the tables.
8- Describe how the study groups were allocated in the methods section.
9- What are the strengths of the study? Please add this information to the article.
10- Please edit the conclusion and write this section more carefully.
11- Can this finding be implemented in clinical policymaking, or are studies with larger sample sizes needed?
12- The article is suitable for publication once the above points have been corrected and completed. Thank you.
