About this report

This open peer review (OPR) report shows the public comments made on this article during peer review, by the reviewers, the associate editor and the editor-in-chief, for every revision round, together with the authors' replies. Comments appear only with the consent of the people who wrote them. Reviewers who chose to sign their report are named; the others are shown as "Referee". Comments are edited for language only, and confidential remarks to the editors are not included.

MAJOR REVISION 3 Apr 2021

This is a good article; however, it has a major problem. The FU period is too short. 12 weeks is not a suitable follow-up period for comparing the scars. Since scar maturation takes a year, on average, it is also better to compare the two groups after a year. This helps to increase the strength of the research.

AUTHORS' RESPONSE TO REVIEWERS

Authors' reply to reviewers

The next pages contain the authors' point-by-point reply to the comments of this revision round, as submitted with the revised manuscript. It is published as the authors wrote it.

Dear Editor,

We appreciate your valuable comment, in this manuscript, the timing of the evaluation of uterine scar after cesarean sections by ultrasound is based on a some of article that attached here:

1. https://pubmed.ncbi.nlm.nih.gov/16023780/ DOI: 10.1016/j.ejogrb.2005.03.023

2. https://pubmed.ncbi.nlm.nih.gov/28186617/ DOI: 10.1002/jcu.22449

In the current context of the Covid 19 crisis, unfortunately, our cases are reluctant to go to the hospital for a second or third ultrasound examination.

Thanks for you
